Datapath Components Subtractor

- Can build subtractor as we built carry-ripple adder
 - Mimic subtraction by hand
 - Compute borrows from columns on left

- Use full-subtractor component:

Datapath Components

Subtractor Example: Color Space Converter – RGB to CMY

- Color
 - Often represented as weights of three colors: red, green, and blue (RGB)
 - Perhaps 8 bits each, so specific color is 24 bits
 - White: R=11111111, G=11111111, B=11111111
 - Black: R=00000000, G=00000000, B=00000000
 - Other colors: values in between, e.g., R=00111111, G=00000000, B=00001111 would be a reddish purple
 - Good for computer monitors, which mix red, green, and blue lights to form all colors

- Printers use opposite color scheme
 - Because inks *absorb* light
 - Use complementary colors of RGB: Cyan (absorbs red), reflects green and blue, Magenta (absorbs green), and Yellow (absorbs blue)

Datapath Components

Subtractor Example: Color Space Converter – RGB to CMY

- Printers must quickly convert RGB to CMY
 - $C = 255 - R$, $M = 255 - G$, $Y = 255 - B$
 - Use subtractors as shown

5

Datapath Components

Subtractor Example: Color Space Converter – RGB to CMYK

- Try to save colored inks
 - Expensive
 - Imperfect – mixing C, M, Y doesn't yield good-looking black
- Solution: Factor out the black or gray from the color, print that part using black ink
 - e.g., CMY of (250,200,200) = (200,200,200) + (50,0,0).
 - (200,200,200) is a dark gray – use black ink

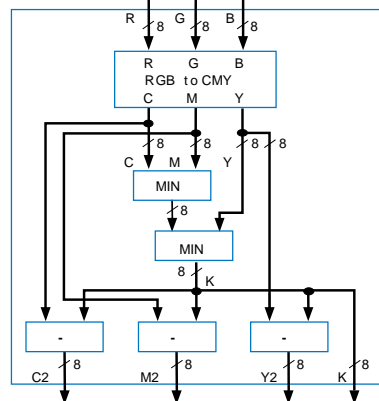

6

Datapath Components

Subtractor Example: Color Space Converter – RGB to CMYK

- Call black part K
 - (200,200,200): $K = 200$
 - (Letter "B" already used for blue)
- Compute minimum of C, M, Y values
 - Use MIN component designed earlier, using comparator and mux, to compute K
 - Output resulting K value, and subtract K value from C, M, and Y values
 - Ex: Input of (250,200,200) yields output of (50,0,0,200)

7

Representing Negative Numbers: Two's Complement

- Negative numbers common
 - How represent in binary?
- Signed-magnitude
 - Use leftmost bit for sign bit
 - So -5 would be:
 - 1101 using four bits
 - 10000101 using eight bits
- Better way: Two's complement
 - Big advantage: Allows us to perform subtraction using addition
 - Thus, only need adder component, no need for separate subtractor component!

8

Ten's Complement

- Before introducing two's complement, let's consider ten's complement
 - Complements for each base ten number shown to right – Complement is the number that when added results in 10
- Nice feature of ten's complement
 - Instead of subtracting a number, adding its complement results in answer exactly 10 too much
 - So just drop the 10 – results in subtracting using addition only

9

Two's Complement is Easy to Compute: Just Invert Bits and Add 1

- Hold on!
 - Sure, adding the ten's complement achieves subtraction using addition only
 - But don't we have to perform *subtraction* to determine the complement in the first place?
 - True – but in binary, two's complement can be computed **easily**
 - Two's complement of 011 is 101, because $011 + 101 = 1000$
 - Could compute complement of 011 as $1000 - 011 = 101$
 - Easier method: Just invert all the bits, and add 1**
 - The complement of 011 is $100 + 1 = 101$ -- it works!

10

Datapath Components *Two's Complement*

- What is the 4-bit binary two's complement representation for the decimal number -5?
 - 0101
 - 1101
 - 1010
 - 1011

11

Datapath Components *Two's Complement*

- What is the 5-bit binary two's complement representation for the decimal number -5?
 - 00101
 - 10101
 - 10011
 - 11011

12

Datapath Components

Two's Complement

- How many bits are needed to represent the number -12 in binary?
- 3
 - 4
 - 5
 - Impossible!

13

Datapath Components

Two's Complement

- What is the 5-bit binary two's complement representation for the decimal number 7?
- 00111
 - 10111
 - 11001
 - Two's complement can only represent negative numbers

14

Datapath Components

Two's Complement

- What is the decimal equivalent the two's complement binary number 111?
- 1
 - 7
 - 1
 - 3

15

Datapath Components

Two's Complement

- What is the decimal equivalent the two's complement binary number 1000?
- 0
 - 1
 - 8
 - 8

16

Datapath Components

Two's Complement

- What is the decimal equivalent the two's complement binary number 0101?
 - 5
 - 5
 - 11
 - Nothing

17

Datapath Components

Two's Complement

- What is the decimal equivalent the two's complement binary number 111111111111?
 - 1
 - 1
 - Who cares?
 - I don't know!

18

Datapath Components

Two's Complement Subtractor Built with an Adder

- Using two's complement

$$A - B = A + (-B)$$

$$= A + (\text{two's complement of } B)$$

$$= A + \text{invert_bits}(B) + 1$$
- So build subtractor using adder by inverting B's bits, and setting carry in to 1

19

Datapath Components

Adder/Subtractor

- Adder/subtractor: control input determines whether add or subtract
 - Can use 2x1 mux – sub input passes either B or inverted B
 - Alternatively, can use XOR gates – if sub input is 0, B's bits pass through; if sub input is 1, XORs invert B's bits

20

Datapath Components

Overflow

- Sometimes result can't be represented with given number of bits
 - Either too large magnitude of positive or negative
 - e.g., 4-bit two's complement addition of 0111+0001 (7+1=8). But 4-bit two's complement can't represent number >7
 - 0111+0001 = 1000 WRONG answer, 1000 in two's complement is -8, not +8
 - Adder/subtractor should indicate when overflow has occurred, so result can be discarded

21

Datapath Components

Overflow: Detecting Overflow: Method 1

- Assuming 4-bit two's complement numbers, can detect overflow by detecting when the two numbers' sign bits are the same but are different from the result's sign bit
 - If the two numbers' sign bits are different, overflow is impossible
 - Adding a positive and negative can't exceed largest magnitude positive or negative
- Simple circuit
 - overflow = $a_3'b_3's_3 + a_3b_3s_3'$
 - Include "overflow" output bit on adder/subtractor

sign bits

$\begin{array}{r} 0\ 1\ 1\ 1 \\ +0\ 0\ 0\ 1 \\ \hline 1\ 0\ 0\ 0 \end{array}$	$\begin{array}{r} 1\ 1\ 1\ 1 \\ +1\ 0\ 0\ 0 \\ \hline 0\ 1\ 1\ 1 \end{array}$	$\begin{array}{r} 1\ 0\ 0\ 0 \\ +0\ 1\ 1\ 1 \\ \hline 1\ 1\ 1\ 1 \end{array}$
overflow (a)	overflow (b)	no overflow (c)

If the numbers' sign bits have the same value, which differs from the result's sign bit, overflow has occurred.

22

Datapath Components

Overflow: Detecting Overflow: Method 2

- Even simpler method: Detect difference between carry-in to sign bit and carry-out from sign bit
- Yields simpler circuit: overflow = $c_3 \text{ xor } c_4$

$\begin{array}{r} 1\ 1\ 1\ 1 \\ 0\ 1\ 1\ 1 \\ +0\ 0\ 0\ 1 \\ \hline 0\ 1\ 0\ 0\ 0 \end{array}$	$\begin{array}{r} 0\ 0\ 0 \\ 1\ 1\ 1\ 1 \\ +1\ 0\ 0\ 0 \\ \hline 1\ 0\ 1\ 1\ 1 \end{array}$	$\begin{array}{r} 0\ 0\ 0 \\ 1\ 0\ 0\ 0 \\ +0\ 1\ 1\ 1 \\ \hline 0\ 1\ 1\ 1\ 1 \end{array}$
overflow (a)	overflow (b)	no overflow (c)

If the carry into the sign bit column differs from the carry out of that column, overflow has occurred.

23

Datapath Components

Arithmetic-Logic Unit (ALU)

- **ALU**
 - Component that can perform any of various arithmetic (add, subtract, increment, etc.) and logic (AND, OR, etc.) operations, based on control inputs
- Motivation:
 - Suppose want multi-function calculator that not only adds and subtracts, but also increments, ANDs, ORs, XORs, etc.

TABLE 4.2 Desired calculator operations

Inputs			Operation	Sample output if A=00001111, B=0000101
x	y	z		
0	0	0	S = A + B	S=00010100
0	0	1	S = A - B	S=00001010
0	1	0	S = A + 1	S=00010000
0	1	1	S = A	S=00001111
1	0	0	S = A AND B (bitwise AND)	S=00000101
1	0	1	S = A OR B (bitwise OR)	S=00001111
1	1	0	S = A XOR B (bitwise XOR)	S=00001010
1	1	1	S = NOT A (bitwise complement)	S=11110000

24

Datapath Components

Arithmetic-Logic Unit (ALU)

- More efficient design uses ALU
 - ALU design not just separate components multiplexed (same problem as previous slide!),
 - Instead, ALU design uses single adder, plus logic in front of adder's A and B inputs
 - Logic in front is called an arithmetic-logic extender
 - Extender modifies the A and B inputs such that desired operation will appear at output of the adder

25

Datapath Components

Arithmetic-Logic Extender in Front of ALU

TABLE 4.2 Desired calculator operations			
Inputs	Operation	Sample output if A=00001111, B=00001001	
x y z	S = A + B	S = 00001000	
0 0 0	S = A - B	S = 00001010	
0 0 1	S = A + 1	S = 00001000	
0 1 0	S = A	S = 00001111	
0 1 1	S = A AND B (bitwise AND)	S = 00001001	
1 0 0	S = A OR B (bitwise OR)	S = 00001111	
1 0 1	S = A XOR B (bitwise XOR)	S = 00001010	
1 1 0	S = NOT A (bitwise complement)	S = 11110000	

- xyz=000: Want $S=A+B$ – just pass a to ia, b to ib, and set cin=0
- xyz=001: Want $S=A-B$ – pass a to ia, b' to ib, and set cin=1
- xyz=010: Want $S=A+1$ – pass a to ia, set ib=0, and set cin=1
- xyz=011: Want $S=A$ – pass a to ia, set ib=0, and set cin=0
- xyz=1000: Want $S=A \text{ AND } B$ – set ia=a*b, b=0, and cin=0
- others: likewise
- Based on above, create logic for ia(x,y,z,a,b) and ib(x,y,z,a,b) for each abext, and create logic for cin(x,y,z), to complete design of the AL-extender component

26

Datapath Components

Register Files

- MxN Register File**
 - Provides efficient access to M N-bit-wide registers
 - If we have many registers but only need access one or two at a time, a register file is more efficient
 - Ex: Above-mirror display (earlier example), but this time having 16 32-bit registers
 - Too many wires, and big mux is too slow

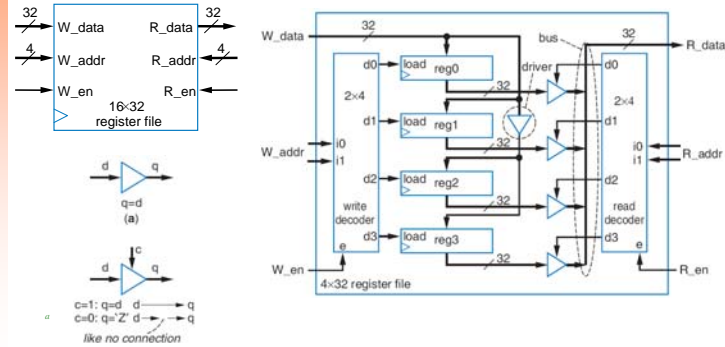

27

Datapath Components

Register Files

- Instead, want component that has one data input and one data output, and allows us to specify which internal register to write and which to read

28

Datapath Components

Register Files: Timing Diagram

- Can write one register and read one register each clock cycle
 - May be same register
